

WHAT IS CLAIMED IS:

1. A semiconductor device comprising:
 - a first semiconductor layer formed on a semiconductor substrate;
 - an outgoing base electrode formed on the first semiconductor layer;
 - a base layer formed on the first semiconductor layer, connected to the outgoing base electrode at a side surface of the outgoing base electrode, and formed of silicon germanium containing carbon; and
 - a second semiconductor layer formed on the base layer.
2. A semiconductor device comprising:
 - a first semiconductor layer formed on a semiconductor substrate;
 - an outgoing base electrode formed on the first semiconductor layer;
 - a base layer formed on the first semiconductor layer, connected to the outgoing base electrode, and formed of silicon germanium containing carbon; and
 - a second semiconductor layer formed on the base layer, the outgoing base electrode and the base layer are formed continuous to each other.
3. A semiconductor device according to claim 1, wherein
the base layer contains carbon by 0.01% to 6%.

4. A semiconductor device according to claim 2,
wherein

the base layer contains carbon by 0.01% to 6%.

5. A semiconductor device according to claim 1,
wherein

a dopant concentration of the base layer at the part
connected to the outgoing base electrode is higher than a
dopant concentration of the base layer immediately below
the second semiconductor layer.

6. A semiconductor device according to claim 2,
wherein

a dopant concentration of the base layer at the part
connected to the outgoing base electrode is higher than a
dopant concentration of the base layer immediately below
the second semiconductor layer.

7. A semiconductor device according to claim 1,
wherein

side-etching of an insulation film immediately below
the outgoing base electrode is below 0.1 μ m.

8. A semiconductor device according to claim 2,
wherein

side-etching of an insulation film immediately below
the outgoing base electrode is below 0.1 μ m.

9. A semiconductor deice according to claim 1,
wherein

the base layer is projected upward beyond the upper

surface of the outgoing base electrode by above 0.02 μ m.

10. A semiconductor device according to claim 2, wherein

the base layer is projected upward beyond the upper surface of the outgoing base electrode by above 0.02 μ m.

11. A semiconductor device according to claim 1, wherein

the first semiconductor layer is a collector layer; and

the second semiconductor layer is an emitter layer.

12. A semiconductor device according to claim 2, wherein

the first semiconductor layer is a collector layer; and

the second semiconductor layer is an emitter layer.

13. A method for fabricating a semiconductor device comprising the steps of:

forming an outgoing base electrode with an opening formed in on a first semiconductor layer formed on a semiconductor substrate; and

forming a base layer of silicon germanium containing carbon at least in the opening; and

forming a second semiconductor layer on the base layer.

14. A method for fabricating a semiconductor device according to claim 13, wherein

the step of forming the base layer includes the step of forming a carbon-content silicon germanium layer in the opening and on the outgoing base electrode; the step of burying a mask material in the opening with the carbon-content silicon germanium layer; and the step of etching the carbon-content silicon germanium layer with the mask material as a mask.

15. A method for fabricating a semiconductor device, comprising the steps of:

forming a base layer of silicon germanium containing carbon and an outgoing base electrode connected to the base layer on a first semiconductor layer formed on a semiconductor substrate, the base layer and the outgoing base electrode being formed continuous to each other; and
forming a second semiconductor layer on the base layer.

16. A method for fabricating a semiconductor device according to claim 13, further comprising:

the step of implanting a dopant in the interface between the base layer and the outgoing base electrode.

17. A method for fabricating a semiconductor device according to claim 14, further comprising:

the step of implanting a dopant in the interface between the base layer and the outgoing base electrode.

18. A method for fabricating a semiconductor device according to claim 15, further comprising:

the step of implanting a dopant in the interface between the base layer and the outgoing base electrode.

19. A method for fabricating a semiconductor device according to claim 16, wherein

in the step of implanting a dopant, the dopant is implanted obliquely to the surface of the semiconductor substrate.

20. A method for fabricating a semiconductor device according to claim 17, wherein

in the step of implanting a dopant, the dopant is implanted obliquely to the surface of the semiconductor substrate.
